

Inter-Disciplinary Intersections and Immunity against Scamming: Of Language Arts, Mathematics, Music and Computer Programming

This book is written to highlight the critical contribution that the named disciplines, collectively, make to rationality in general. It posits that rationality can be successful against scamming. It is mainly targeted at educators and intellectually inclined persons, regardless of their formal level of education. It implicitly impresses upon educators that they are very significant in the world-wide fight against scamming. Being properly intellectual prepared to fight against such a crime is markedly a more potent force than that manifested by law enforcement. Intersections are represented graphically using the set theory concept of intersecting sets via 2-way and 3-way intersections. The topics are used as elements of the sets and the required descriptions of each are then given in a glossary. Expositions are then given on scamming, the realms of scamming, the scammers and the scammed. For the purpose of basic understanding of intersections for those who are unfamiliar, a learning section is given at the beginning. The book is informative, based on creative thinking and makes for an intriguing read.
